For my part in the project, I was doing more of a front end design. My aim was to have a simple design with minimalist concepts due to the fact that one of our target users are elderly people. The design pattern helped improve the quality of the code in terms of processing speed. As seen in the UML diagram above, unlike the previous UML provided, this one has more of a straightforward path. This straightforward path can be used throughout the entire code to enhance the processing and buffer speeds of the pages. Unfortunately I was unable to figure out some of the issues within the code to actually see it work, therefore I couldn't commit this to the main branch in the Github, but the plan is to fix these issues and see to it that this concept works fully.
